## Amendments to and Listing of the Claims:

- 1-10 (Cancelled)
- 11. (Currently Amended) A method of assessing the viability of a spore after a sterilization treatment, comprising:
  - (a) exposing a spore to a sterilization treatment;
  - (b) examining the treated spore of step (a) using multiangle light scattering; and
  - (c) evaluating a difference between the multiangle light scattering of the treated spore and a multiangle light scattering of a like spore not exposed to a sterilization treatment to evaluate a change in spore morphology and determine whether the treated spore is viable.
- 12. (Previously Presented) The method of claim 11, wherein the spore and the like spore are selected from the group consisting of a *B. subtilis* spore, and a *B. stearothermophilus* spore.
- 13. (Previously Presented) The spore of claim 12, wherein the spore and the like spore are *B. subtilis*.
- 14. (Previously Presented) The spore of claim 12, wherein the spore and the like spore are *B. stearothermophilus*.
- 15. (Previously Presented) The method of claim 11, wherein the sterilization treatment is selected from the group consisting of a chemical sterilization treatment, and a physical sterilization treatment.
- 16. (Previously Presented) The method of claim 15, wherein the chemical sterilization treatment is selected from the group consisting of an ethylene oxide sterilization treatment, a hydrogen peroxide sterilization treatment, a tetrasilver tetraoxide sterilization treatment, and an ozone sterilization treatment.
- 17. (Previously Presented) The method of claim 15, wherein the physical sterilization treatment is selected from the group consisting of a radiation sterilization treatment, a gas plasma sterilization treatment, a steam sterilization treatment, and a dry heat sterilization treatment.
- 18. (Previously Presented) The method of claim 11, further comprising examining the like spore using multiangle light scattering prior to the sterilization treatment of the spore in

- step (a) to provide a standard multiangle light scattering data set for use as the multiangle light scattering of the like spore in step (c).
- 19. (Previously Presented) The method of claim 18, further comprising storing the standard multiangle light scattering data to assess viability of a second like spore after sterilizing the second like spore using the sterilization treatment of step (a).
- 20. (Previously Presented) The method of claim 11, further comprising incubating the treated spore with a growth medium prior to step (b).
- 21. (Previously Presented) The method of claim 20, wherein the growth medium is selected from the group consisting of trypticase soy broth, nutrient broth, and brain heart infusion broth.
- 22. (Previously Presented) The method of claim 20, further comprising incubating the spore up to about 24 hours prior to step (b).
- 23. (Previously Presented) The method of claim 20, further comprising heat-shocking the treated spore prior to incubating the treated spore with the growth medium.
- 24. (Previously Presented) The method of claim 11, wherein the sterilization treatment is selected from the group consisting of a steam sterilization treatment, and an ozone sterilization treatment, and the method further comprises examining the treated spore directly after the sterilization treatment.
- 25. (Previously Presented) A method of assessing the efficacy of a sterilization treatment, comprising
  - (a) exposing a biological indicator to a sterilization treatment;
  - (b) examining a like biological indicator using multiangle light scattering to create a standard profile;
  - (c) examining the treated biological indicator using multiangle light scattering to create a post-sterilization profile; and
  - (d) comparing the post-sterilization profile of the treated biological indicator to the standard profile of the like biological indicator, wherein a difference between the post-sterilization profile of the treated biological indicator and the standard profile of the like biological indicator indicates the efficacy of the sterilization treatment.
- 26. (Previously Presented) The method of claim 25, wherein the biological indicator and the like biological indicator are *B. subtilis* spores.

- 27. (Cancelled)
- 28. (Previously Presented) The method of claim 25, wherein the sterilization treatment is selected from the group consisting of a physical sterilization treatment, and a chemical sterilization treatment.
- 29. (Previously Presented) The method of claim 28, wherein the chemical sterilization treatment is selected from the group consisting of a tetrasilver tetraoxide sterilization treatment, an ethylene oxide sterilization treatment, a hydrogen peroxide sterilization treatment, and an ozone sterilization treatment.
- 30. (Previously Presented) The method of claim 28, wherein the physical sterilization treatment is selected from the group consisting of a radiation sterilization treatment, a gas plasma sterilization treatment, a dry heat sterilization treatment, and a steam sterilization treatment.
- 31. (Previously Presented) The method of claim 25, wherein the sterilization treatment is selected from the group consisting of a steam sterilization treatment, and an ozone sterilization treatment, and the method further comprises examining the treated spore directly after the sterilization treatment.
- 32. (Previously Presented) A method of detecting a change in a biological indicator exposed to a sterilization treatment, comprising exposing a biological indicator to a sterilization treatment, and comparing a multiangle light scattering of the treated biological indicator to a multiangle light scattering of a like biological indicator not exposed to a sterilization treatment, wherein a difference between the multiangle light scattering of the treated biological indicator and the multiangle light scattering of the like biological indicator indicates a change in the treated biological indicator.
- 33. (Previously Presented) The method of claim 32, further comprising incubating the treated biological indicator with a growth medium for up to about 24 hours before examining the multiangle light scattering of the biological indicator.
- 34. (Previously Presented) The method of claim 33, further comprising heat-shocking the biological indicator prior to incubating the biological indicator with the growth medium.
- 35. (Previously Presented) The method of claim 32, further comprising using an instrument selected from the group consisting of a nephelometer, and a photometer to examine the multiangle light scattering of the biological indicator.

Application No. 10/091,260 Reply to Office Action of May 25, 2004

36. (Previously Presented) The method of claim 32, wherein the sterilization treatment is selected from the group consisting of a steam sterilization treatment, and an ozone sterilization treatment, and the method further comprises examining the treated spore directly after the sterilization treatment.

37.-38. (Cancelled)
